

Record, Edit, View, Create!

Using familiar Microsoft screens and tools, **VStreamIP** lets you broadcast video over your network, displaying via projectors or on individual workstations. Download video from broadcast schedules, then edit or broadcast it at a set time or store it for retrieval on demand. Add a video camera and editing software, and students can create a TV station especially for the school!

Record

from TV schedules

VStream IP allows you to record broadcasts from schedules, downloading video to a designated server. You can set the server up to record programmes or whole series in advance. And, if the programme is rescheduled for any reason, VStream will automatically record it when it is broadcast.

Edit

to tailor resources

Using the DMS VStream workstation, video may be edited to create montages of programmes and overlaying graphics, music or commentary; whatever is required to develop the resource that is needed.

View

live and on-demand

Video may be streamed across the network as it is being broadcast, so programmes may be viewed live if required. Also, it may be accessed on-demand from the network by teachers and other authorised users selecting specific clips to support their teaching requirements.

Create!

a school TV station

As well as creating unique clips by editing professional material, students may be encouraged to make their own video productions, perhaps with a view to developing a TV station for the school which could also be accessible via the school intranet to parents. This resource can serve the media studies faculty too.

Multiple Indexing

Programmes may be indexed with several markers each. This saves editing programmes into separate parts, whilst allowing teachers to just choose relevant clips rather than the whole programme.

High Definition TV

DMS' video editing workstation's TV tuner can take a high resolution HD signal, at 1080 lines. Its output is also HD so you see the best possible graphics results from the system.

Advert Stripping

Indexing may also be used to mark commercials which may be skipped when the recording is played back.

Remote Access

DMS can arrange for authorised users to log in to VStream over the internet. This can enable teachers to set recording schedules from home.

Microsoft Compatible

Like all DMS' solutions, VStream is based on Microsoft technology; no proprietary routes have been taken in developing the VStream solution.

Design and Management Systems helps schools and colleges to optimise their network infrastructure, from one that is high on technician management time, to one that manages itself with minimal interaction, leaving technicians free to develop the network.
